DEFINITION: An estimator O is called the Best Linear Unbiased

Estimaton (BLUE) for 0 if

1. 0 is a linear combination of sample observations.

2. Var(0)

Var(0'), where 0'is any other estimators which is unbiased and 0 is about an UE.

nestorict own set of estimators to those which are in data and renbiased. Among all these estimators, the one with minimum variance and we call it in data we bick

Theorem (Gauss-Markov Theorem): The Gravers-Markov theorem states that the ordinary least square estimator of B is the Best Linear Unbiased (Estimator (BLUE).

From OLS estimation, we have $\beta = (x/x)^{-1}x/y$ $E(\hat{\beta}) = \beta$ and $Von(\hat{\beta}) = \sigma^2(X'X)^{-1}$

Wenced to show: For MLR model, Y = XB + E with E(E) = 0 and V(E) = 0? The LSEs are unbiased and minimum and V(t) — when compared to all other unbiased estimators. Variance when combination of y_is , thus, LSEs are BLUE, that are linear combination of y_is , thus, LSEs are BLUE,

· We comider that \(\beta \) to be the best which minimizes the variance for any l'\(\beta \). \(\beta \).

Now, Von (1/3) = 021(x/x)-11 = scalon.

Let B be another unbiased estimator of B which is a linear combination of data. Our goal, then is to show that var (1/B) > (21/(x/x)-1).

We use the fact that any other estimators of 13 can be written as &= [(x'x)-1x'+B]Y+bopx1

E(B) = B+BXB+Bo, However, B is ansumed to be biased, hence bo = 0 and BX = 0. Similarly, it can be shown that

Von (B) = 02 [(X/X)-1 X'+BB'].

Since BB'is positive semi-definite, we can see that 2BB's =(B'L)'(B'L)>0

Hence Bis the BLUE. MOTE: MLES for the model parameters are the LSES of the LR (MLR) Example: Comider the following data in the Malik.

· (b) Table of fitted values and westduals; Calculate: SS Res, SST, SSRay.
$\begin{array}{c ccccccccccccccccccccccccccccccccccc$
$SS_{\text{total}} = \int (y_i - \overline{y})^2 = \int \gamma_i^2 - n\overline{\gamma}^2 = 289 - 11\times9 = 190$
SSReg = SSTOTA - SSRes = 190-68 = 122.
ANOVA Table,
Source of DF SS MS=\$5 F=MSReg Variation
122 61
Regression 2 112 Revidual 8 68 8:5
Revidual Total 10 190 Total O linear relationship
Now, we test the following; Vs. HI: Bi to for at least one i Vs. HI: Bi to for at least one i (linear relationship) Tilt > Fo.05, 2,8 = 4.46 (from statistice
So, we right the $\beta_1=\beta_2=0$ and we use the fitted equation: $\gamma = 4-2x_1-0.5x_2 $ (famis linear relationship that equation is statistically significant. (c) $R^2 = \frac{SSReg}{SST} = \frac{12^2}{190} = 64.21\%$. Thus, the regression model (fitted) explains 64.21% of the total than, the regression model (fitted) explains 64.21% of the total
(c) $R^2 = \frac{SSReg}{SST} = \frac{12^2}{190} = 64.21\%$. Thus, the regression model (fitted) explains 64.21% of the total variability in the target ramiable (Yi) using two variability variables (X) and X2).
variability in the taught rumand ()

coural () variables (X) and X2).

(d) $E(\beta) = \beta \cdot V(\beta) = \delta^2(x/x)^{-1}$; we know $E(MSRes) = \sigma^2$. Estimated = V(B) = MSRes (X'X)-1 Vaniance of B = V(B) $= 8.5 \times \left(\begin{array}{cccc} 4.3705 & -0.849 & -0.4086 \\ 0.169 & 0.8222 \\ 0.0422 \end{array}\right)$ V(Bi)= 62(XX): Estimated variance of $\beta_1 = MSRes (X'X)_{11}^{-1}$ = 8.5 X 0.169 = 1.43 Estimated variance of $\beta_2 = 8.5 \times (X'X)_{22}^{-1} = 8.5 \times 0.0422 = 0.35$ Ho; B2=0 Ys. H1: B2 ≠0 (Poortial test) (e) t= \frac{\lambda^{32}}{Ms_{Res}(x'x)^{-1}} = \frac{-0.5}{\sqrt{0.35}} = -0.83 Let us also test: How much XI contribute given that X2 is also also in the respection?

Ho: \\BI=0 \quad Vs. \\BI\neq 0 $t = \frac{31}{\sqrt{\frac{1.4365}{11.4365}}} = \frac{-2}{\sqrt{1.4365}} = 1.668$ |t| \$ to.025,8 = 2.306. We accept the B1=0. Then, X1 is not significant in the model in the presence of X2. This is an example of: GILOBAL test says K1. X2 are PARTIAL test says nether XI(X2)
is significant in the powence of
X2(X1).
This example explains the problem of MULTICOLLINEARITY.

(f)	Χı	Y	Ŷ	e
•	1	6 8 	8·135 5·054	- 2·135 2·946

This its the problem of SLR. We get using OLS estimates:

Y = 9.162 - 1.027X1
= Bo + BIX1.

	A	NOVA Table	1		
Source of	DF	S S	Ms	F	
Source of Variation		116	116	14.15	
Regression	1	116	4.0		
V Residual	9	74	8.2		<u></u>

10 Total

Fo.05,1,9 = 5.12 (from statistical table)

So, the fixed model is significant.

This suggests XI is more capable to explain the variability in y in compared to X2.

$$\chi_{6} = (1, \chi_{01}, \chi_{02}) = (1, 3, 5)$$

Point estimator of y: yo = x.p Vor (jo) = 20 V(p) 20
